

Reliably measuring the host galaxy mass of luminous AGN with GRAHSP

Johannes Buchner

Max Planck Institute for extraterrestrial Physics

<http://astrost.at/istics/>
eROSITA2024 conference

Why study host galaxies also of type 1 AGN

- Test coevolution link

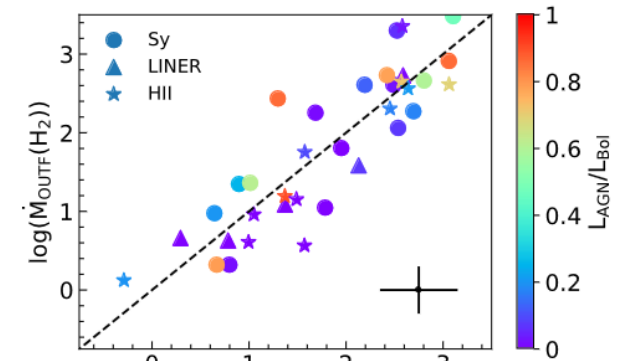

$$M_{\star} - M_{\text{BH}}$$

$$\text{SFR} - L_{\text{AGN}}$$

- type-1/2 dichotomy:
orientation or evolution?

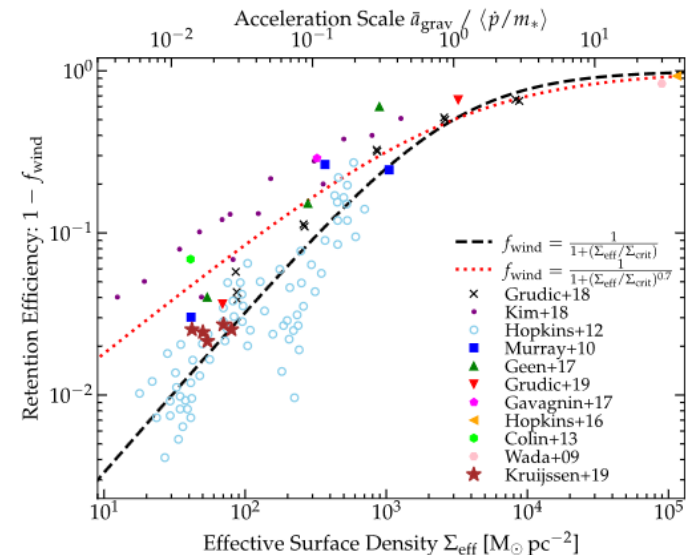

Outflows scale with gravitational potential (M_{\star})

$$1.13 \log\left(1.29 \frac{\text{SFR}}{M_{\odot}/\text{yr}} + 0.81 \frac{L_{\text{AGN}}}{10^{43} \text{erg/s}}\right) - 0.37 \log\left(\frac{M_{\star}}{10^{11} M_{\odot}}\right)$$

Observations: Fluetsch+20

see also Harrison & Ramos Almeida (2024)

$$M_{\star} / \text{pc}^2$$

Simulation compilation: Hopkins+22

The eROSITA challenge: 1 million AGN

The eROSITA X-ray all-sky survey:

Galaxy: UV to MIR

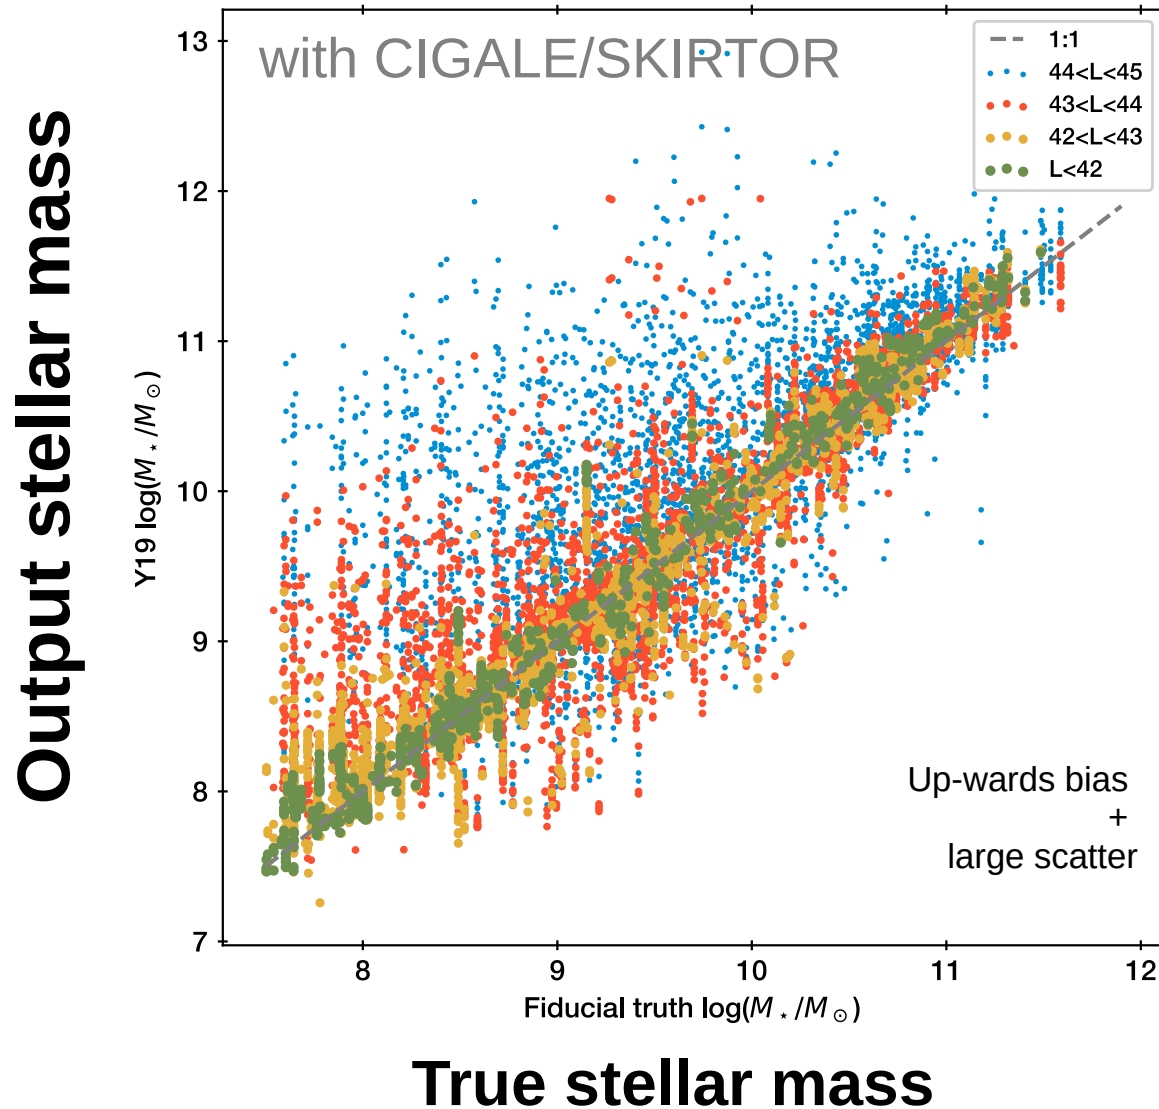

first clean large selection of AGN

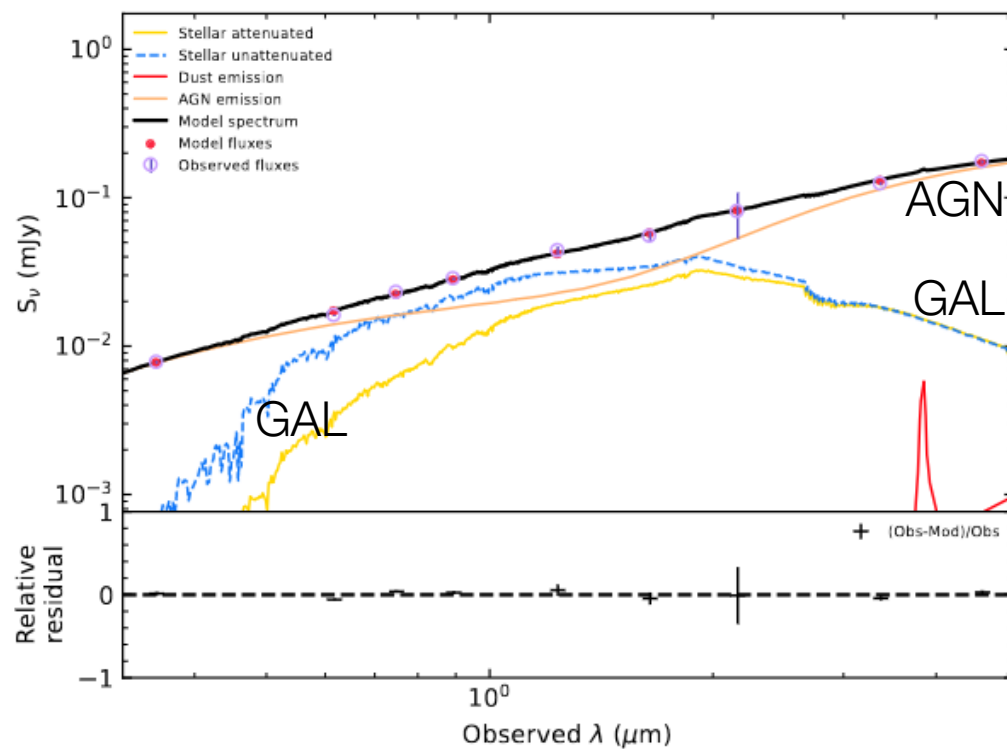

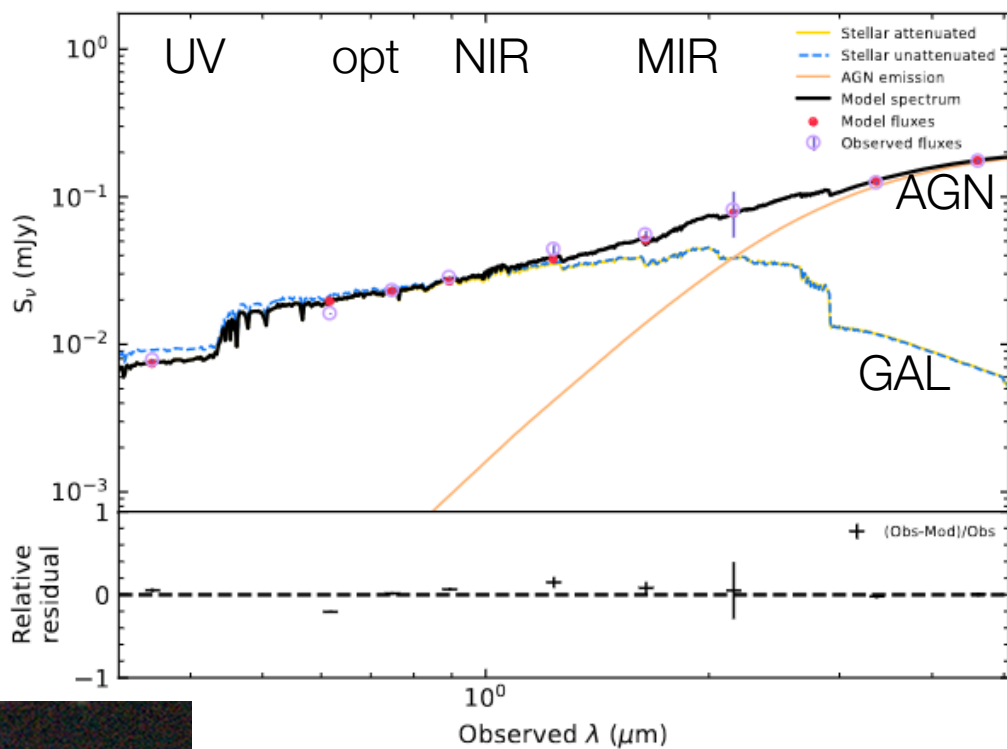

type 1 emit light in all wavelengths

Problem: Host estimation is biased

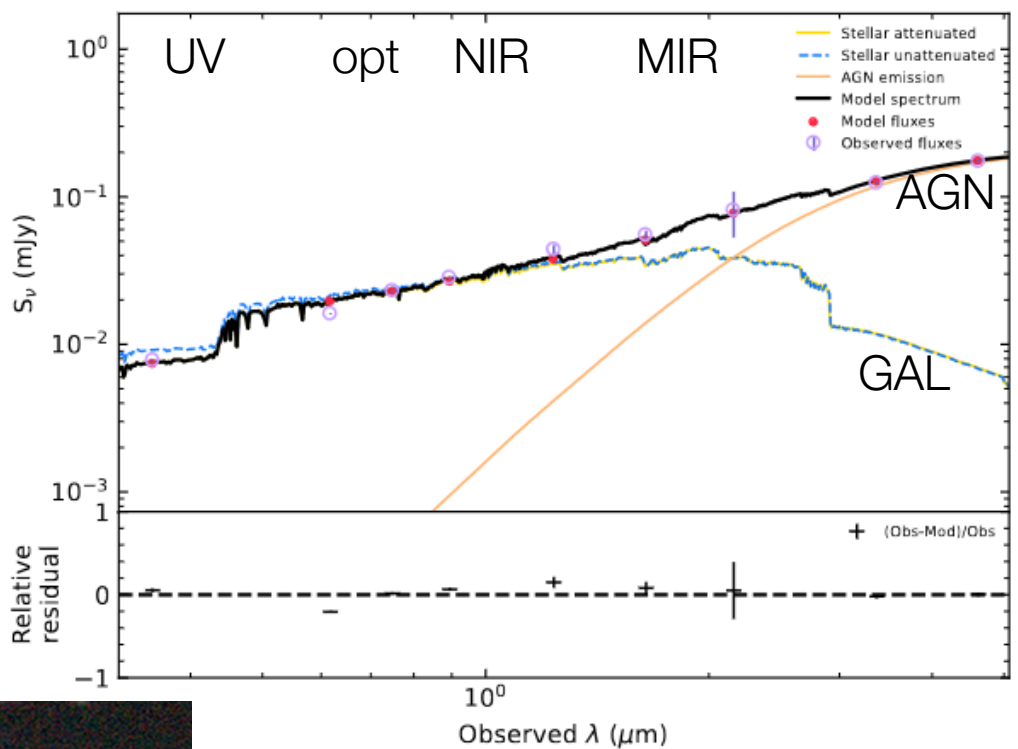

- What causes the bias?
- How can we fix it?
- What about SFR?
- How do you know this?

Galaxy + AGN model A \longleftrightarrow Galaxy + AGN model B

Which is the right decomposition?

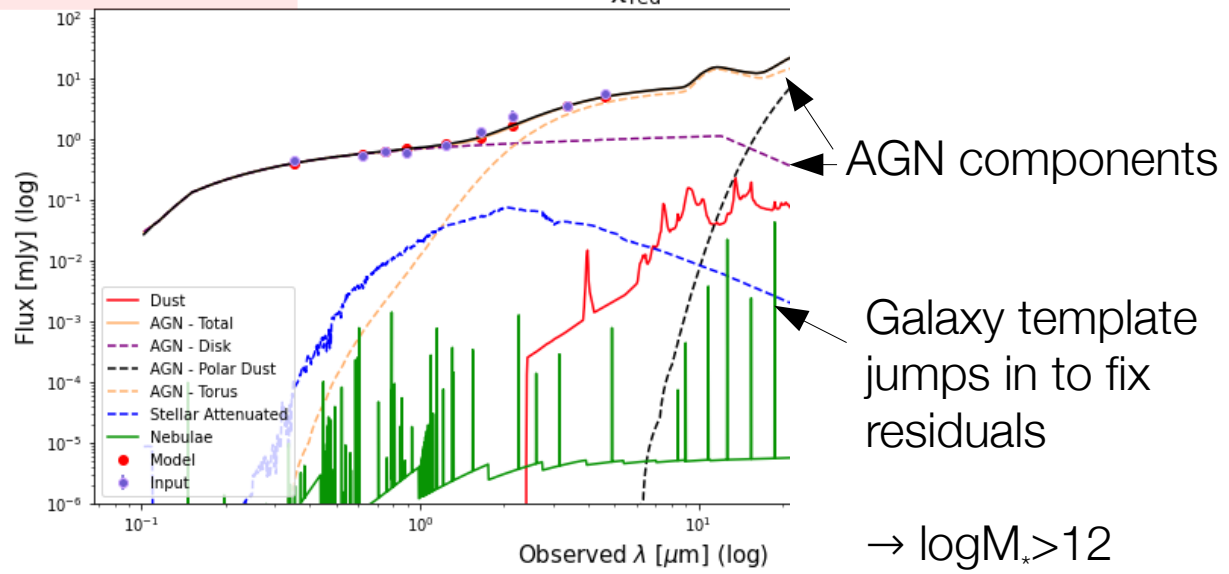

Galaxy + AGN model A \longleftrightarrow Galaxy + AGN model B

Which is the right decomposition?

Failure mode: ID: 240990, $z = 0.2056$, $\chi^2_{red} = 1.2$, Q^{\dagger}

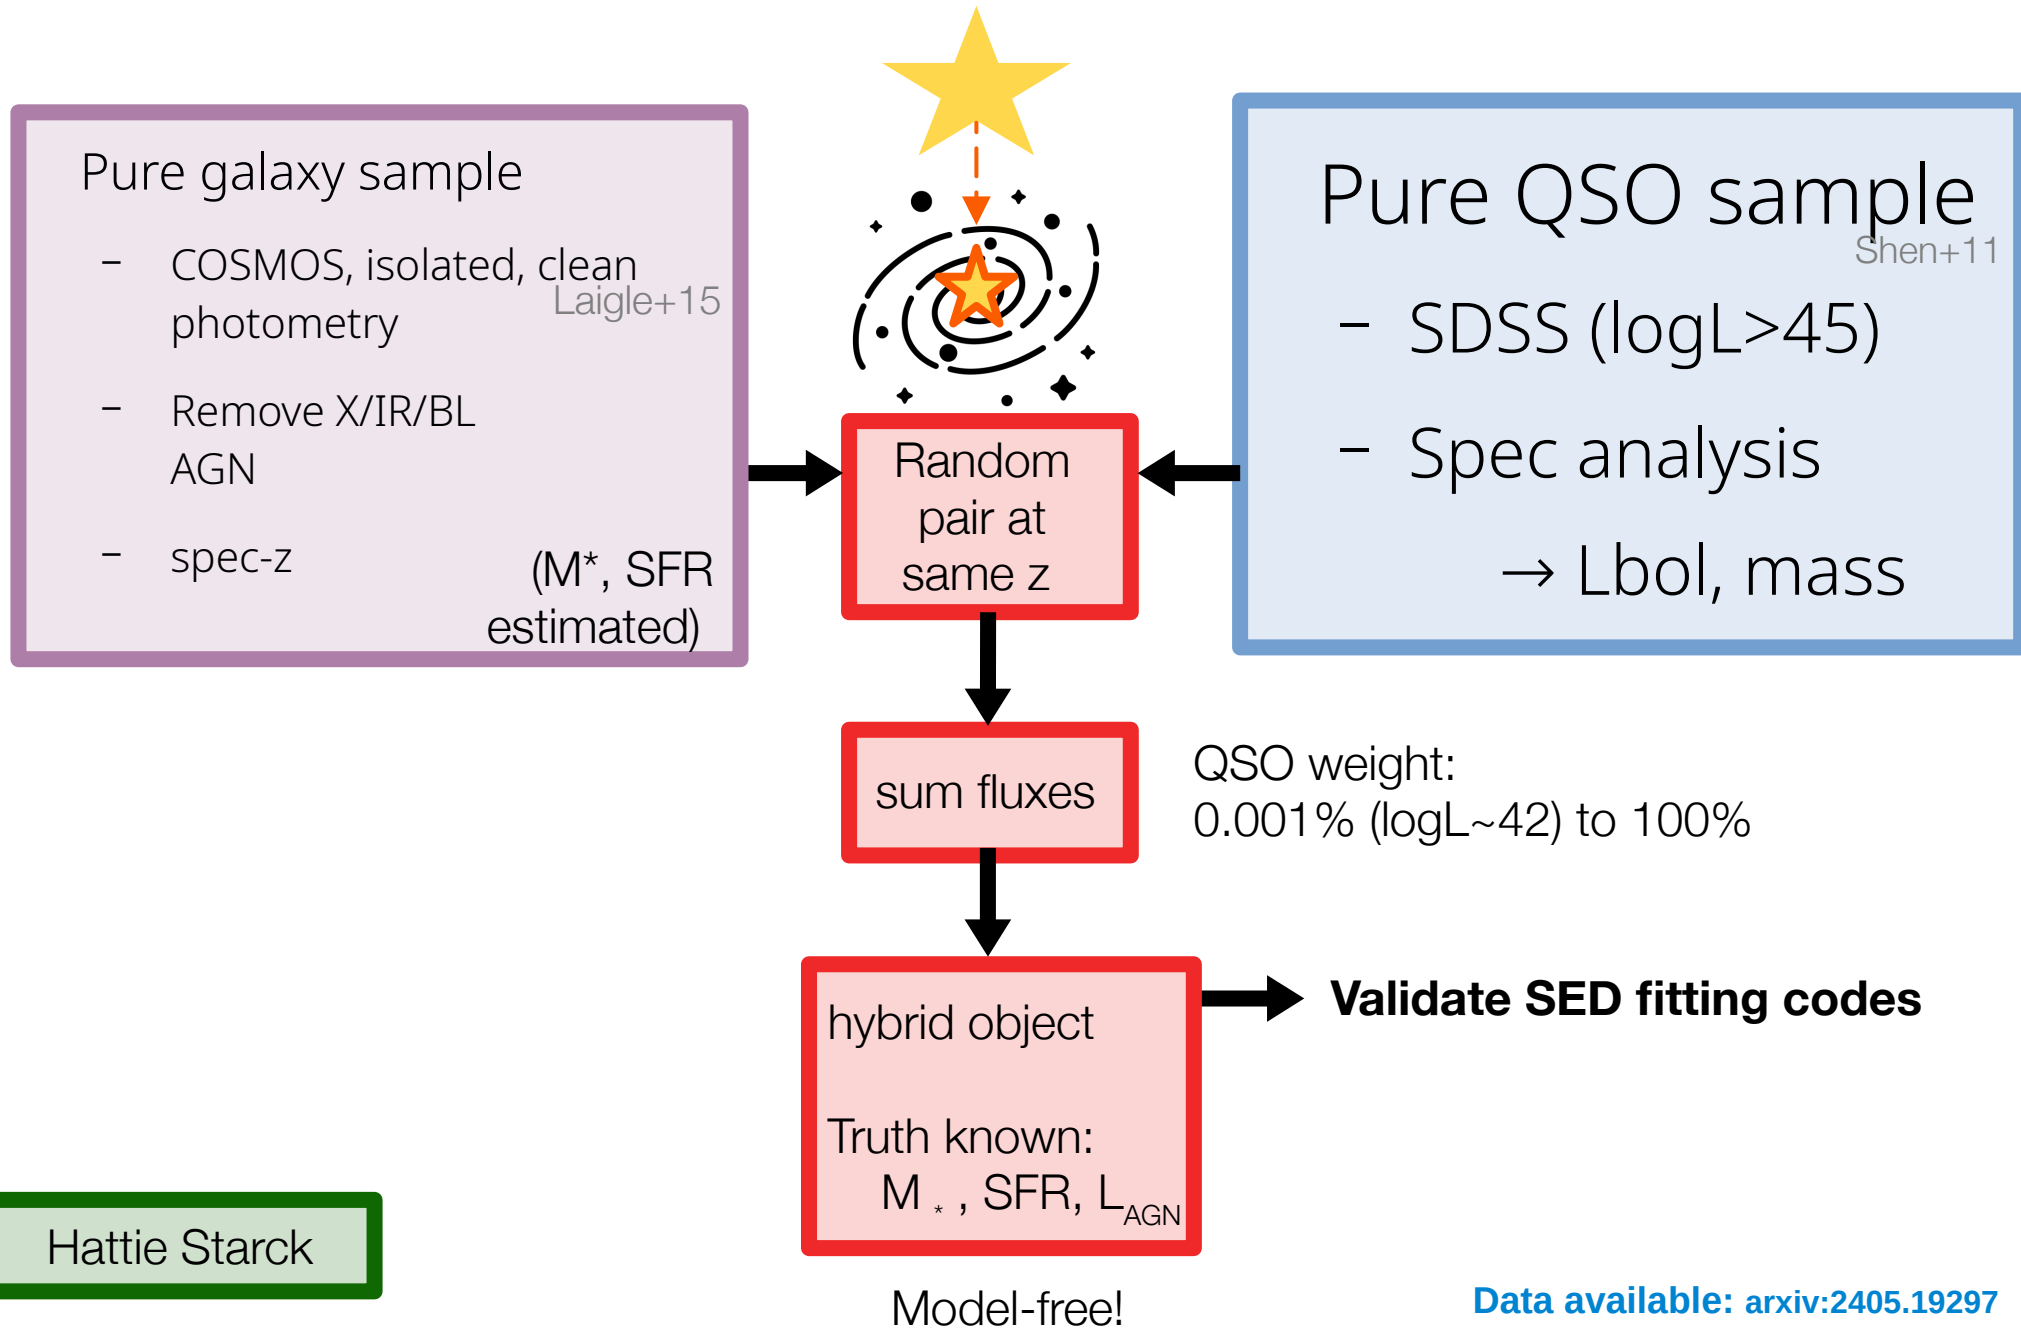

Different model \rightarrow very different answers with small statistical error bars!

- \rightarrow cannot be discovered from fit quality
- \rightarrow cannot be addressed with simulations with the fitted model
- \rightarrow systematic up-bias in M^* & SFR

Can induce SFR - L(AGN) correlation
 Can induce M^* - L(AGN) correlation

The Chimeras benchmark

Hattie Starck

Data available: [arxiv:2405.19297](https://arxiv.org/abs/2405.19297)

An all-encompassing benchmark data set

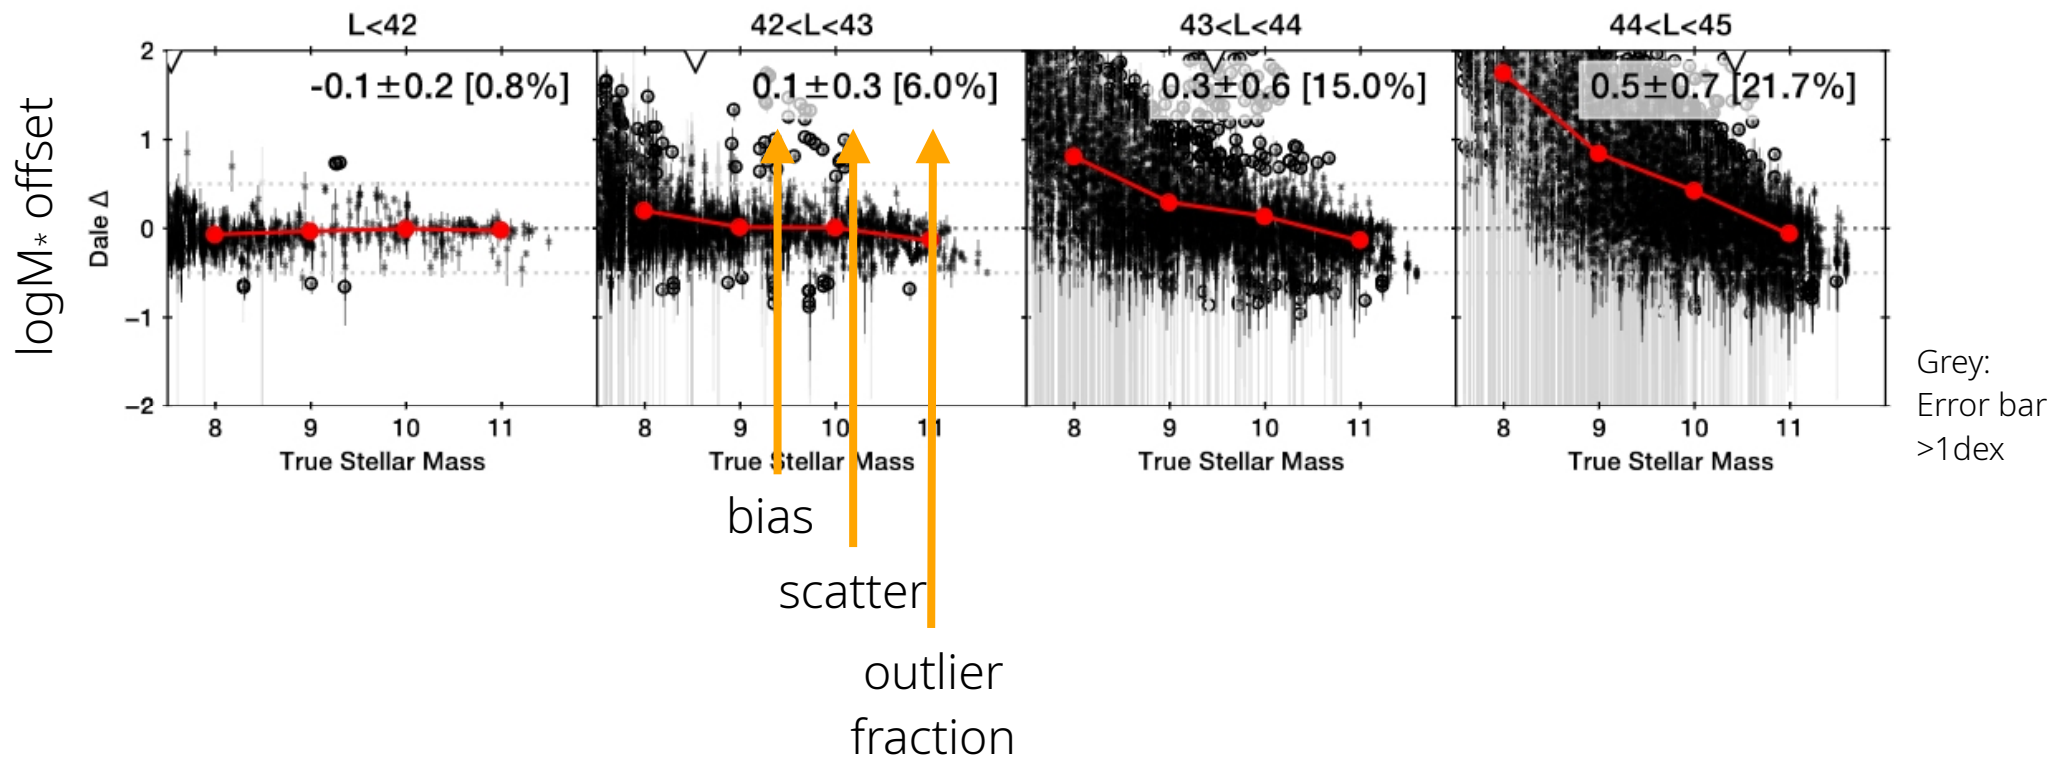

Now also used in the
Euclid collaboration

Results: M^* bias & scatter

bias to AGN light contamination

AGN luminosity \rightarrow

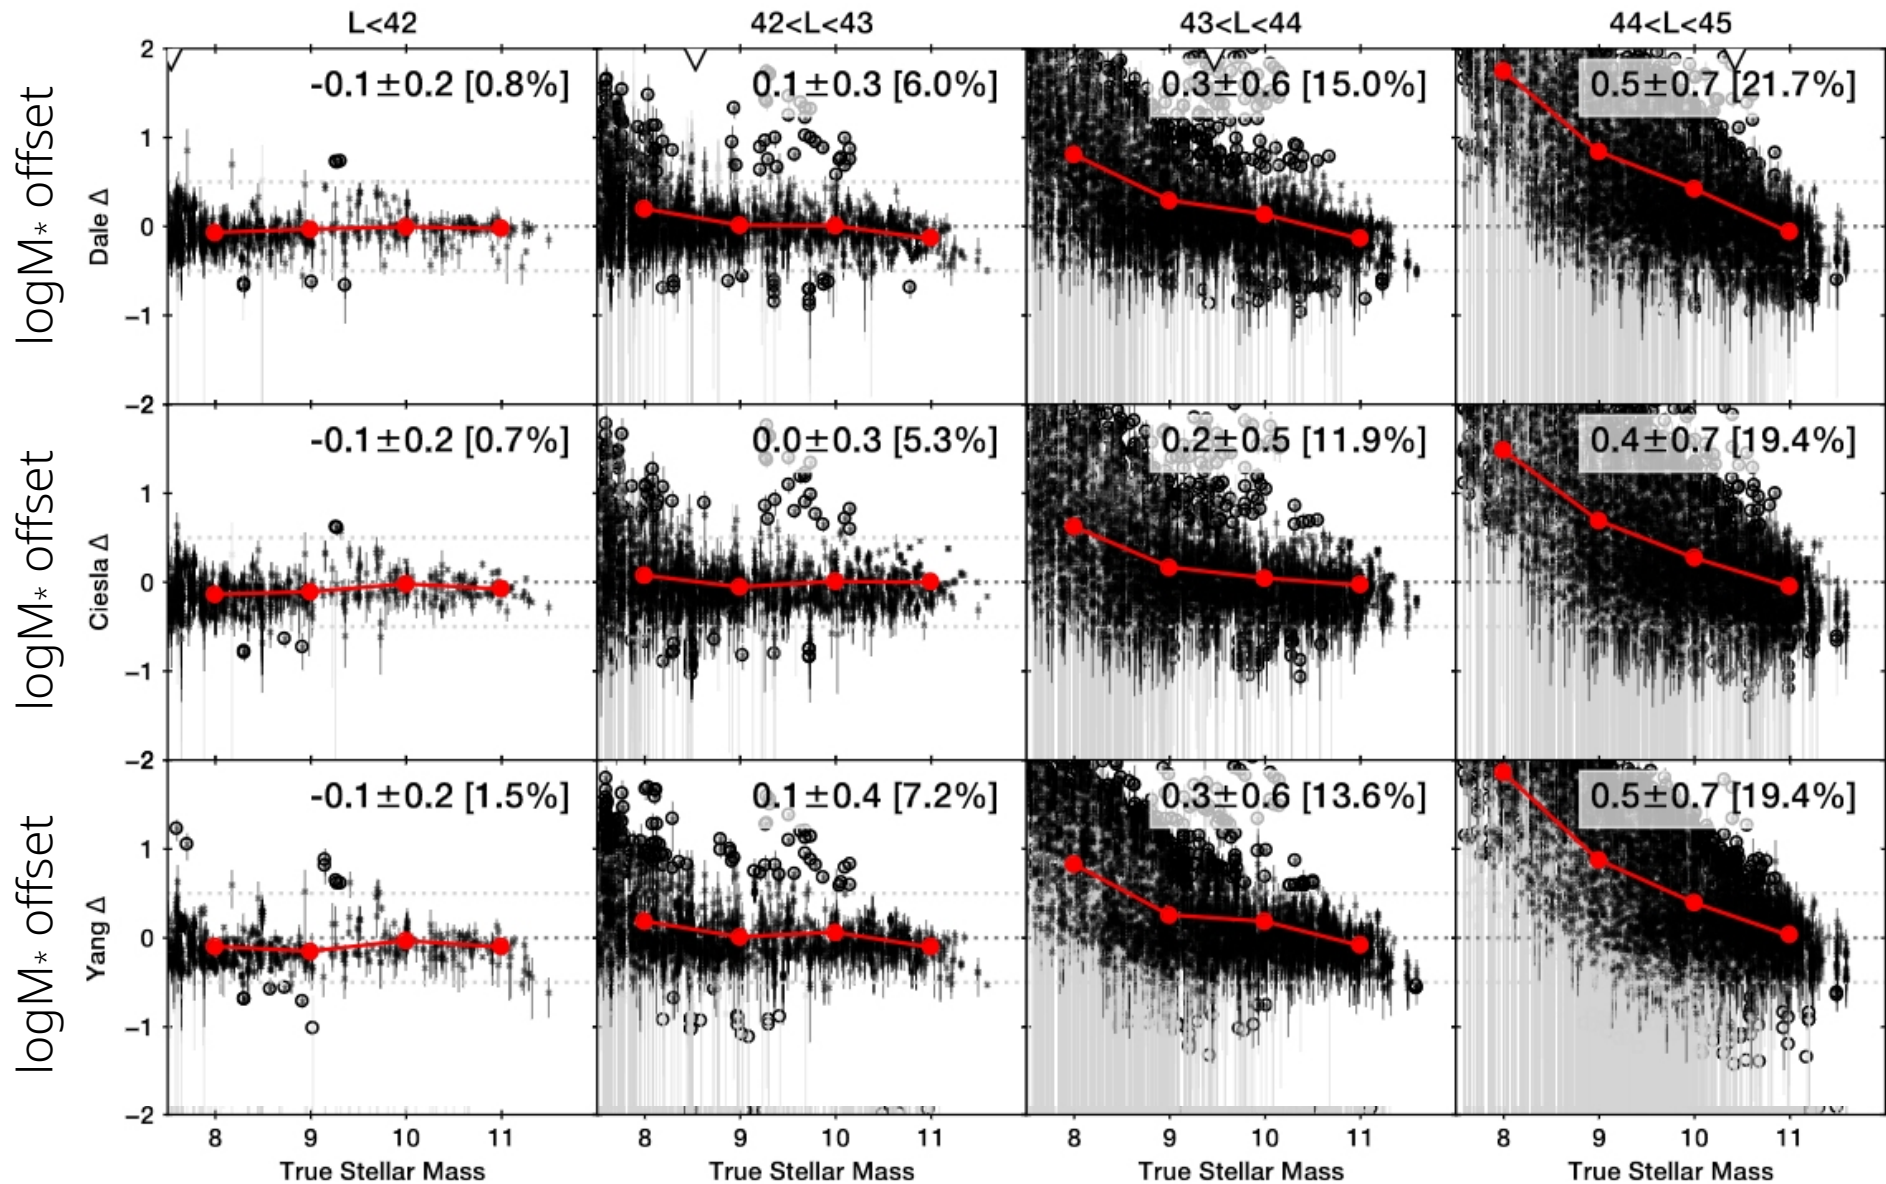

Model details:

- Delayed exponential - star formation episode BC03 SPS
- attenuation & energy-conserving re-emission in IR
- AGN: Dale+14, single parameter for AGN fraction

Current popular tool: CIGALE

3 different model setups

up-bias & large scatter also for SFR

Our new tool: GRAHSP

Unbiased retrieval: AGN does not cause a systematic over-estimation

of stellar mass, SFR & AGN luminosity

Realistic error bars – no longer dominated by systematics

Full details: [arxiv:2405.19297](https://arxiv.org/abs/2405.19297)

The road to “unbiased” host estimates

GRAHSP approach:

Flexible, high-precision AGN model

→ many parameters

→ advanced fitting engine UltraNest

3min/source/CPU

Does it work? Reproduces:

1) Nearby AGN broad-band spectra
Brown et al AGN ATLAS

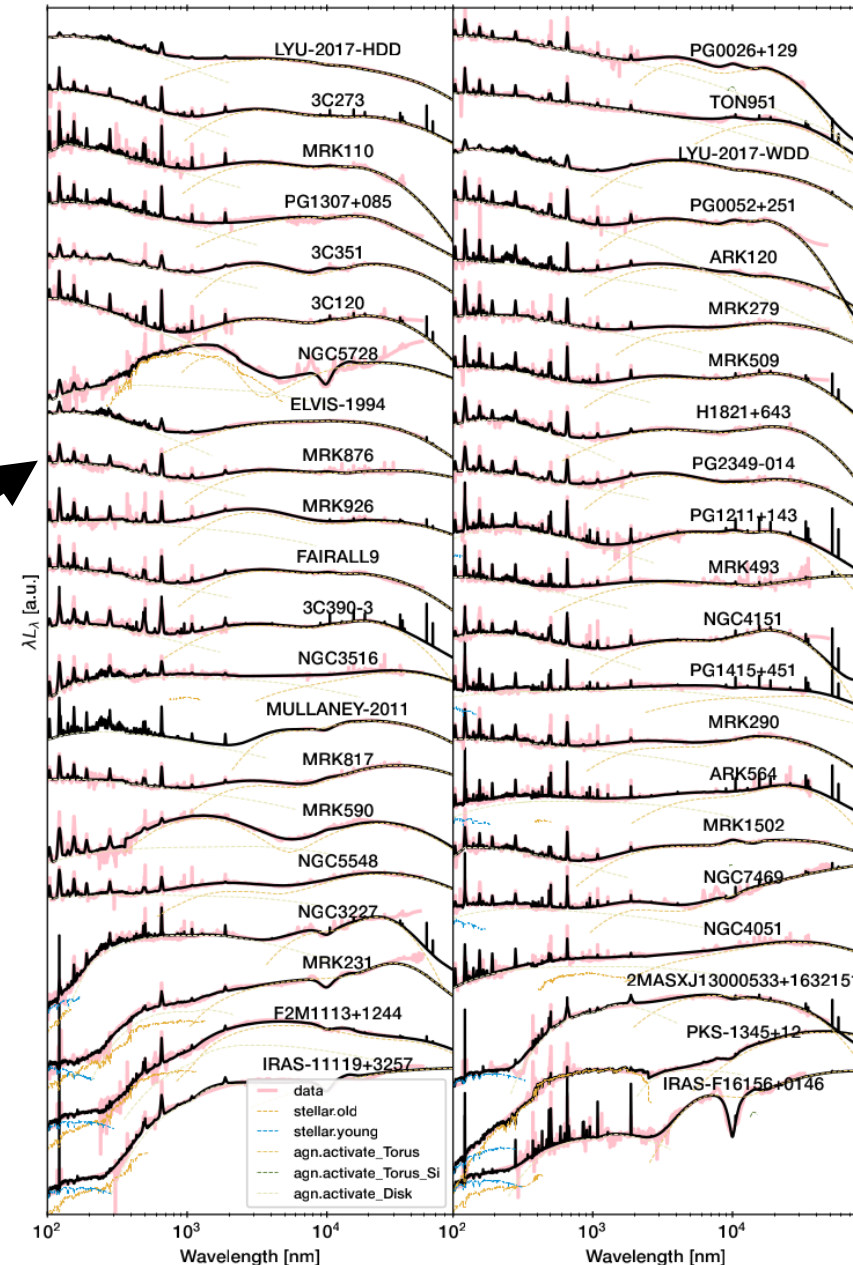

2) stacked optical quasar spectra

3) polarized-spectroscopy of the disk

4) emission lines

5) Color distributions vs z

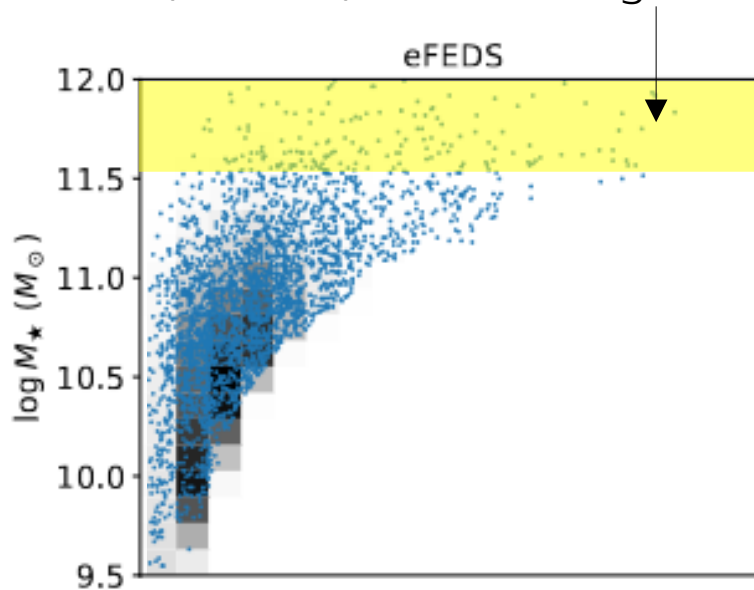

and unbiased retrieval of SFR, M_*

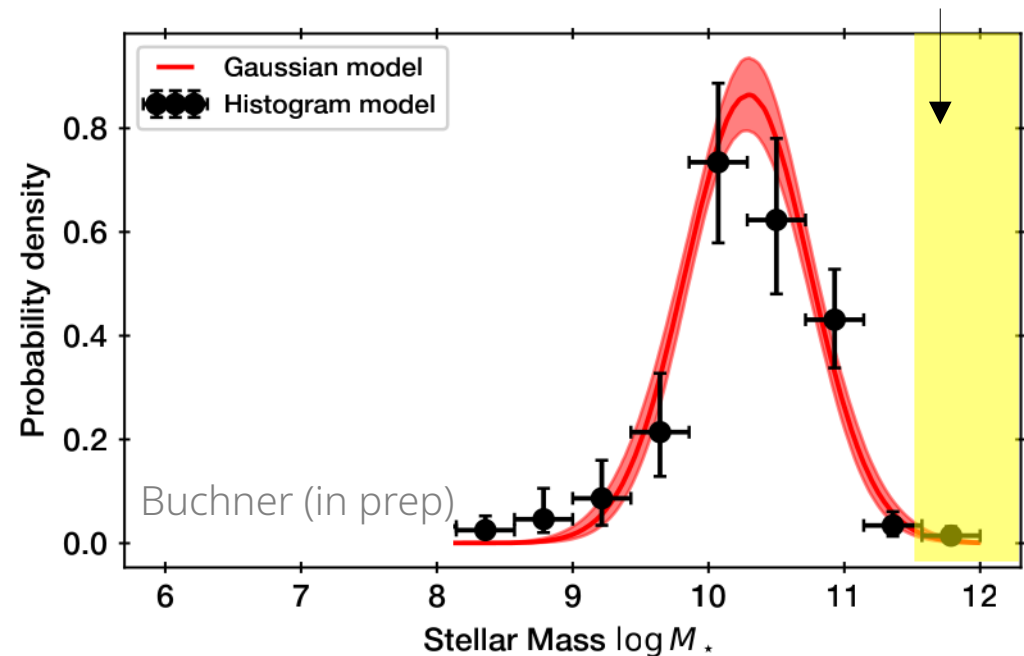

Consequences

M^* - L_{AGN} relation (slope specific accretion rate)

Before (Zou+24): in massive galaxies

Now: no extremely massive galaxies

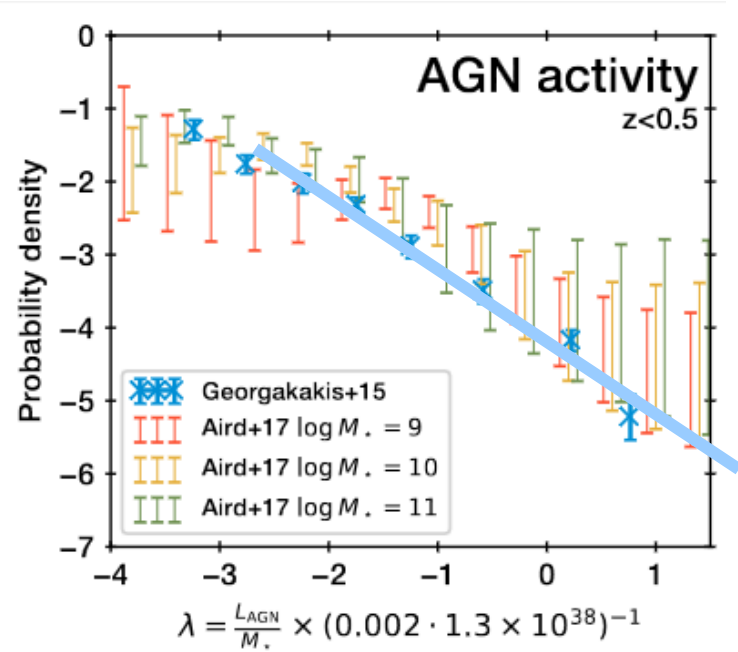

Future work

type 1/2 triggering differences

M^* - M_{BH} relation of AGN

→ L_{AGN}/M^* "Eddington ratio" change
→ changes impact of outflows

quasar-mode outflows vs. SF & jets

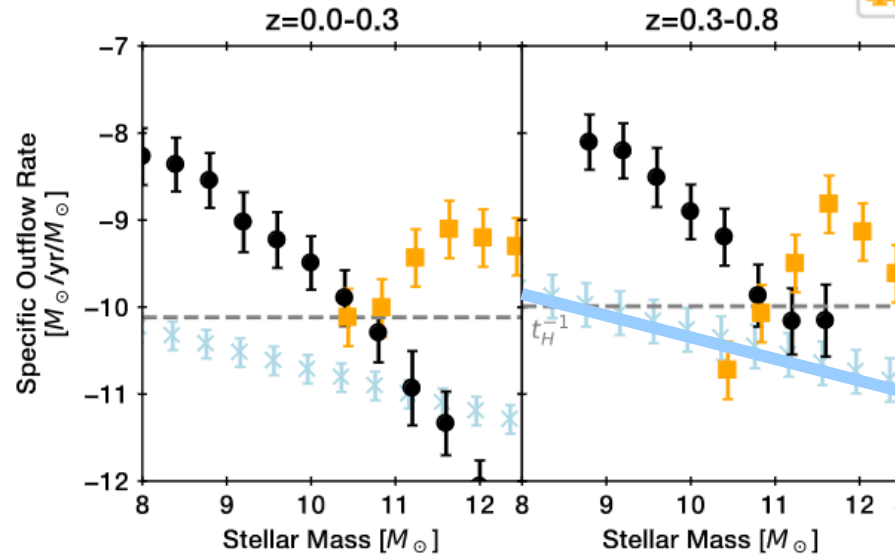

SAR = L_{AGN}/M_{*}

=

- Hubble time, inverse
- Outflows from SF
- ⊗⊗⊗ Outflows from AGN
- Bubbles by AGN Jets

AGN-driven outflows not a dominant gas removal mechanism

→ arxiv:2407.11127

What halts the growth of galaxies?

Johannes Buchner

The gas reservoir of galaxies can be altered by outflows driven by

Evolution of galaxies and black holes

taking a data-science approach with mega-surveys

- New “unbiased” tool for quantifying AGN hosts
GRAHSP
- Scales to large surveys bright future: eROSITA, Euclid, VRO, ... Athena
→ see poster by Nikolas Vasilas
- Sample entire life cycle of AGN phase

trace the processes building stars and black holes

address flickering with large sample:

How?

GRAHSP AGN model components

- flexible, empirical AGN model + model uncertainty
- state-of-the-art Bayesian inference engine UltraNest,
scales to large samples and many parameters

+ SMC-like nuclear reddening

Test #1: quasar spectra

Test #2: colors

Average colors of quasars?

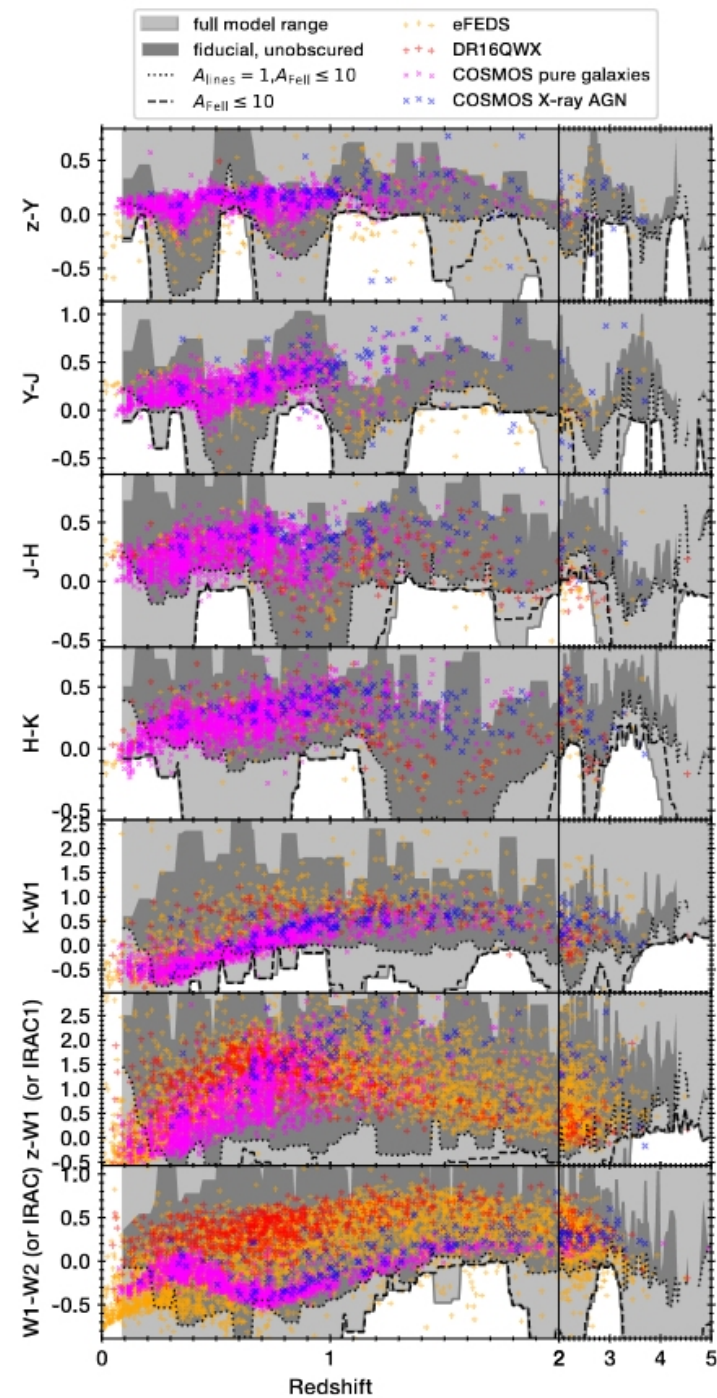

Temple, Hewett & Banerji 2023

Diversity of colors of AGN & galaxies

Test #2: full diversity of colors

Test #3: Brown AGN SED Atlas

- Compilation of spectra and photometry
- Extinction-corrected, aperture-corrected
